

Install the UMRA service using a local account

Jacob Carlone - 2016-03-22 - UMRA

In cases where the UMRA server cannot reach a domain controller, it may be necessary to complete the service installation using a local account.

- Create a local admin account named UmraSvcAccount
- Login locally with the UmraSvcAccount user
- Open the UMRA console and start the service installation wizard
- On the account specification page, enter the username and password of the local UmraSvcAccount user

Manage 'UMRA Service' wizard

Specify the user account for the UMRA Service
You can specify an existing account and password or create a new account.

When started, the UMRA Service uses the specified account to log on. By default, the account 'UmraSvcAccount' in the domain of the target computer is used.

Specify service account:

Account name: ...

Password:

Confirm password:

If the account does not exist, it is created with the specified password. If the account does already exist, you must specify the password of the account. The password that is specified by default is a randomly generated strong password.

< Back Next > Cancel Help

- Complete the service installation wizard
- Open services.msc
- Locate the UMRA service
- Open the UMRA service's properties
- Navigate to the Log On tab
- Change the service account to the intended domain user
- Restart the UMRA service
